SCADAPack 32P

IEC 61131-3 Quick Start Guide Setup Manual

5/19/2011

The information provided in this documentation contains general descriptions and/or technical characteristics of the performance of the products contained herein. This documentation is not intended as a substitute for and is not to be used for determining suitability or reliability of these products for specific user applications. It is the duty of any such user or integrator to perform the appropriate and complete risk analysis, evaluation and testing of the products with respect to the relevant specific application or use thereof. Neither Schneider Electric nor any of its affiliates or subsidiaries shall be responsible or liable for misuse of the information contained herein. If you have any suggestions for improvements or amendments or have found errors in this publication, please notify us.

No part of this document may be reproduced in any form or by any means, electronic or mechanical, including photocopying, without express written permission of Schneider Electric.

All pertinent state, regional, and local safety regulations must be observed when installing and using this product. For reasons of safety and to help ensure compliance with documented system data, only the manufacturer should perform repairs to components.

When devices are used for applications with technical safety requirements, the relevant instructions must be followed. Failure to use Schneider Electric software or approved software with our hardware products may result in injury, harm, or improper operating results.

Failure to observe this information can result in injury or equipment damage.

Safety Information

Read these instructions carefully, and look at the equipment to become familiar with the device before trying to install, operate, or maintain it. The following special messages may appear throughout this documentation or on the equipment to warn of potential hazards or to call attention to information that clarifies or simplifies a procedure.

The addition of this symbol to a Danger or Warning safety label indicates that an electrical hazard exists, which will result in personal injury if the instructions are not followed.

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

DANGER

DANGER indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.

AWARNING

WARNING indicates a potentially hazardous situation which, if not avoided, **can result** in death or serious injury.

CAUTION indicates a potentially hazardous situation which, if not avoided, **can result** in minor or moderate.

CAUTION

CAUTION used without the safety alert symbol, indicates a potentially hazardous situation which, if not avoided, **can result** in equipment damage.

PLEASE NOTE

Electrical equipment should be installed, operated, serviced, and maintained only by qualified personnel. No responsibility is assumed by Schneider Electric for any consequences arising out of the use of this material.

A qualified person is one who has skills and knowledge related to the construction and operation of electrical equipment and the installation, and has received safety training to recognize and avoid the hazards involved.

BEFORE YOU BEGIN

Do not use this product on machinery lacking effective point-of-operation guarding. Lack of effective point-of-operation guarding on a machine can result in serious injury to the operator of that machine.

EQUIPMENT OPERATION HAZARD

Verify that all installation and set up procedures have been completed.

Before operational tests are performed, remove all blocks or other temporary holding means used for shipment from all component devices.

Remove tools, meters, and debris from equipment.

Failure to follow these instructions can result in injury or equipment damage.

Follow all start-up tests recommended in the equipment documentation. Store all equipment documentation for future references.

Software testing must be done in both simulated and real environments.

Verify that the completed system is free from all short circuits and grounds, except those grounds installed according to local regulations (according to the National Electrical Code in the U.S.A, for instance). If high-potential voltage testing is necessary, follow recommendations in equipment documentation to prevent accidental equipment damage.

Before energizing equipment:

- Remove tools, meters, and debris from equipment.
- Close the equipment enclosure door.
- Remove ground from incoming power lines.
- Perform all start-up tests recommended by the manufacturer.

OPERATION AND ADJUSTMENTS

The following precautions are from the NEMA Standards Publication ICS 7.1-1995 (English version prevails):

- Regardless of the care exercised in the design and manufacture of equipment or in the selection and ratings of components, there are hazards that can be encountered if such equipment is improperly operated.
- It is sometimes possible to misadjust the equipment and thus produce unsatisfactory or unsafe operation. Always use the manufacturer's instructions as a guide for functional adjustments. Personnel who have access to these adjustments should be familiar with the equipment manufacturer's instructions and the machinery used with the electrical equipment.
- Only those operational adjustments actually required by the operator should be accessible to the operator. Access to other controls should be restricted to prevent unauthorized changes in operating characteristics.

About The Book

At a Glance

Document Scope

This manual describes the quick start procedure for the SCADAPack 32P controller using IEC 61131-3 firmware.

Validity Notes

This document is valid for all versions of SCADAPack 32P and IEC 61131-3.

Product Related Information

UNINTENDED EQUIPMENT OPERATION

The application of this product requires expertise in the design and programming of control systems. Only persons with such expertise should be allowed to program, install, alter and apply this product.

Follow all local and national safety codes and standards.

Failure to follow these instructions can result in death, serious injury or equipment damage.

User Comments

We welcome your comments about this document. You can reach us by e-mail at technicalsupport@controlmicrosystems.com.

Overview

This document is meant to be a guide to help new users configure, program and operate the SCADAPack 32 controller in a timely fashion. It is not meant as a substitute for the IEC 61131-3 and SCADAPack 32 Controller manuals, but rather as a companion to these manuals. A strong background in both programmable logic controllers (PLC) and personal computers (PC) using Windows is highly recommended. If you experience any difficulty during the setup, it may be necessary to then consult the appropriate manual or call the Control Microsystems Technical Support Department for assistance.

Quick-Start Procedure

This section of the manual is a starting point in the development of an IEC 61131-3 application for a SCADAPack 32P controller. Each of the steps listed below is fully described in the following sections. This manual and the IEC 61131-3 User's Guide are be used together to provide the information needed to create, load and run an application.

- Prepare the SCADAPack32P.
- Install IEC 61131-3.
- Create an IEC 61131-3 project.
- Declare variables.
- Select I/O hardware.
- Select custom functions and function blocks.
- Configure PC to controller Link.
- Configure controller commands and options.
- Make the application.
- Download and start the application.

Prepare the SCADAPack32P

In this step the SCADAPack32P controller is prepared for connection to a PC that will be running IEC 61131-3. Referring to the graphic and directions below we will:

- Connect a power suitable power source.
- Clear any existing programs in the SCADAPAck32 and set the communication parameters to a default value.
- Connect a serial cable between the SCADPack32 and the PC.

Connect Power

The SCADAPack32 requires an 11 to 24Vdc power source. Connect this source to the **DC PWR** terminals and check proper polarity. The power source is **NOT** to be turned on at this time.

Cold Boot the SCADAPack32 Controller

A Cold Boot of the SCADAPack32 erases any programs and sets the serial communication parameters to default values. The default parameters are Modbus RTU, 9600 baud, no parity and 1 stop bit.

To perform a Cold Boot:

- Press and hold down the LED POWER button.
- Turn **ON** the 11 to 24Vdc power source..
- Continue holding the **LED POWER** button for 25 seconds until the **STAT** Led begins to flash on and off continuously.
- Release the LED POWER button.

Connect serial cable between SCADAPack32 and PC.

Connect a null modem cable from a PC serial port to COM2 on the SCADAPack32. This cable is used to connect from an RJ-45 based RS-232 port on the SCADAPack 32P controller to DE-9P connector on a DTE such as a PC. A 10 ft. long cable is available from Control Microsystems as part number TBUM297217.

Install IEC 61131-3 Software

Insert the IEC 61131-3 IEC 61131-3 CD into the CD ROM drive. The CD will autorun and start the installation wizard. Follow the installation wizard instructions to install the IEC 61131-3 programming software.

When first installed IEC 61131-3 will run in the **Demo Mode** until a permanent license is installed. The Demo version will run for a maximum of 30 days. This Quick Start Guide can be used in the IEC 61131-3 Demo Mode. Refer to the IEC61131 User and Reference manual for further information on installing the license for IEC 61131-3.

The following message is displayed when **Projects** is selected from the IEC 61131-3 3.5 program group.

When running in the Demo Mode IEC 61131-3 does not support the following features:

- Archiving or Restoring projects.
- Exporting IEC 61131 programs to a library.
- Exporting variables.
- Embedding project source code in a target controller.
- Uploading source code from a target controller.

You will need to permanently license your copy of IEC 61131-3 version 3.5 in order to use the above listed features.

Start IEC 61131-3

Start IEC 61131-3 by selecting IEC 61131-3 for SCADAPack from the Windows Start menu. From the list of items select Projects to open IEC 61131-3. The IEC61131 User and Reference Manual can be selected from the menu items.

Create an IEC 61131-3 Project

When IEC 61131-3 is started the Project Management window is opened. This window displays all IEC 61131-3 Projects that are installed on the PC running IEC 61131-3.

To create a new project, select New from the File menu.

File Edit Project Tools Options Help Open Ctrl+O Image: Tools Image:	🚷 ISaGRAF - Project Management	- 🗆 🗙

The New command opens the **Create New Project** dialog. Enter a name such as **MyProj** into the **Name:** window and click the **OK** button to create the project.

Quick-Start Procedure

Create new project	×
Name: MyProj	<u>0</u> K
10 configuration:	<u>C</u> ancel
(none)	

Select the Controller Type for the Project

Projects in IEC 61131-3 are created for a specific controller type. To select the SCADAPack 32P controller open the **Controller** commands from the **Tools** menu and select **Controller Type** from the Controller commands.

🔩 ISaGRAF - MYPROJ - Programs		
File Make Project	Tools Debug Options	Help
🖹 🖬 🕹 🕮	Import from library Export to library

		DNP Status
		DNP Master Status
		I/O Error Indication
		Lock Controller
		Unlock Controller
		Override Controller Lock
		C/C++ Program Loader
		Program Status

When the Controller Type command is selected the Select Controller Type dialog is opened. Use the menu selector at the right of the window to select **SCADAPack 32P** and then click the **Select** button.

Select Controller Type	
Controller Type	Select
SCADAPack 32P	Cancel

Configure Serial Connection to SCADAPack 32P

A communication link is used to connect IEC 61131-3 and the target SCADAPack32 controller. IEC 61131-3 controls the downloading of applications to the target controller, monitoring the applications running in the target controller and the starting and stopping of applications in the target controller.

The IEC 61131-3 PC-PLC Link parameters define how the communication link between the PC and the target controller functions. To open the PC_PLC link parameters dialog:

Select Link setup from the Debug menu.

📢 ISaGRAF - MYPROJ	Programs	
File Make Project Tools	Debug Options	Help
	Debug Simulate Workspace Link setup	· · · · · · · · · · · · · · · · · · ·

When selected the PC-PLC Link Parameters dialog is displayed.

Target Slave Number:	1	<u>0</u> K

Control		Setup
Time out (seconds):	3	Truth
Retries:	3	

Click the **Setup** button to open the **Communication Protocols Configuration** dialog and set the communication parameters.

Communication Protocols Configur	ation
Communication Protocols ClearSCADA DNP DNP/TCP DNP/UDP Modbus ASCII Modbus ASCII in TCP Modbus ASCII in UDP Modbus RTU in TCP Modbus RTU in UDP Modbus/TCP Modbus/UDP Modbus/UDP Modbus/USB SCADAServer	OK Cancel Configure

Check that **Modbus RTU** is highlighted and click the Configure button. The **Modbus RTU Configuration** dialog is opened.

Mo	dbus RTU Configu	ration
General Advanced Information		
Communication Component - Modbus RTU Control Microsystems Inc.		
	Modbus Communicati	on Settings
	<u>A</u> ddressing	Standard 💌
	<u>S</u> tation	1
	<u>T</u> imeout	3 seconds
	Attempts	3
	Serial Port Settings	
<	Port	СОМ1
	<u>B</u> aud	9600 💌
	Pagity	None
	Stop Bits	1 bit 💌
	Connection Type	Direct Connection
		Restore <u>D</u> efaults
_		OK Cancel

The **Modbus Communication Settings** grouping contains Modbus specific communication settings.

- Set the Addressing parameter to Standard.
- Set the Station parameter to 1.
- Set the **Timeout** parameter to **3**.
- Set the Attempts parameter to 3.

This **Serial Port Settings** grouping contains details directly related to the PC's communication port including the port number, the baud rate, parity and stop bit settings.

Set the **Port** parameter for the PC serial port to use. The drop-down list will display available serial ports on the PC. The available serial ports list will include any USB to serial converters used on the PC.

- Set the **Baud** parameter to 9600.
- Set the Parity parameter to none.
- Set the Stop Bits parameter to 1.
- Set the Connection Type parameter to Direct Connection.

Confirm Serial Connection to SCADAPack 32P

To confirm that the PC is able to communicate with the SCADAPack32 controller a check of the Real Time Clock can be made. To select the Real Time Clock command open the **Controller** commands from the **Tools** menu and select **Real Time Clock** from the Controller commands list.

Real Time Clock Se	ttings MYPROJ		
Controller time	9/1/2010 4:22:08PM	_	Close
Image: Set to <u>PC</u> Time PC time	9/1/2010 4:22:17PM		<u>₩</u> nte
C Set to user Enter	red Time		1
Year (1997-2096)		2010	
Month (1-12)		9	
Day of Month (1-31)		1	
Hour (0-23)		16	
<u>M</u> inute (0-59)		22	
Second (0-59)		8	
C Adjust Forward of Adjust Clock by Sec	w Backward		

When the serial connection is correctly configured between the PC and the SCADAPack controller the **Real Time Clock Settings** dialog is displayed.

If the serial connection is not set correctly or the serial cable is not connected the communication will not occur. The following dialog will be displayed. Repeat the steps above to ensure the serial connection is properly configured.

Declare Variables

Before any programs can be written the variables used in the application are declared. Variables are declared using the Dictionary dialog in IEC 61131-3. To open the dictionary dialog select **Dictionary** from the **File** menu in the Programs window. Any number of internal variables may be created. A maximum of 32 I/O variables may be created unless a protection key is installed.

Modbus Registers

Modbus registers are called network addresses in the Dictionary. Analog variables declared in the Dictionary are 32-bit format. This means two Modbus registers will be automatically assigned to an analog variable within the controller. Refer to the Modbus Addressing section of the IEC 61131-3 User and Reference manual for complete information on how Modbus registers are used in IEC 61131-3 applications.

The dictionary dialog will use hexadecimal format for the network address when the dialog is first opened. To change the format to decimal:

- Select Advanced options from the **Tools** menu in the Programs window.
- Click the Network addresses in decimal option.

Input / Output Variables

Variables with the attribute input or output are assigned to I/O Boards or I/O Equipment in the I/O Connection dialog. Only variables of these types may be assigned to physical hardware input or output devices.

Select I/O Hardware

The term I/O hardware refers to the physical input and output devices that are accessed by the application program in the target controller. The I/O hardware is divided into two types, I/O boards and I/O equipment. I/O boards are 5000 I/O modules and controller onboard I/O such as counter/digital inputs, interrupt input, RAM battery voltage and board temperature. I/O equipment are I/O modules that contain multiple types of I/O such the SCADAPack 32 lower I/O modules.

I/O boards and equipment are defined using the I/O connection dialog in IEC 61131-3. To open the I/O connection dialog select <u>I/O connection</u> from the **Project** menu in the Programs window.

Select Functions and Function Blocks

Functions and function blocks are used in programs written in any of the IEC11 31-3 languages. Descriptions and examples of IEC 61131-3 functions and function blocks are found in section **B.9 Standard operators, function blocks and functions** of the IEC 61131-3 User's Guide.

Control Microsystems custom functions and function blocks have been added to the standard IEC 61131-3 environment. These functions support features provided by the SCADAPack controllers.

Controller Commands and Options

Controller commands are specific to the operation of SCADAPack controllers. Operating parameters are configured using selected controller commands. Controller commands are selected from the **Controllers** selection in the <u>T</u>ools menu of the Programs window. Controller parameters such as serial port settings, initialization, I/O module indication and controller locking functions are configured using controller commands. Control of the connection and disconnection of dialup modem communication links and reading and writing parameters to the controller are also executed using controller commands.

Make the Application

Before an application may be downloaded to the target controller it must be compiled. Compiling an IEC 61131-3 project is done using the **Make Application** command.

To make an application:

- Select **Compiler** Options from the <u>Make</u> menu in the Programs window. The Compiler Options dialog appears.
- In the **Targets:** list, select **ISA86M: TIC code for Intel**. This is the target Independent Code dedicated to IEC 61131-3 kernels installed on Intel based processors.
- Select the appropriate compiler options for you project by clicking the square to the right of the option in the **Optimizer:** section of the dialog.
- If you wish to be able to upload the project from a controller select the Upload button and then, in the Prepare project for upload dialog click the Embed source code for upload option. Select the parameters you wish to upload in the Embed also: window. Click the <u>OK</u> button to close the dialog.
- Click on the <u>Select</u> button to select the target and then click the <u>OK</u> button to close the dialog.
- Select Make application from the Make menu in the Programs window.
- The Code Generator window opens and a listing of the compiler output messages are displayed as the application is made.

If there are any errors, shown in red text, the application is not made. The application will not be made until the errors are corrected.

Once corrections have been completed and the application has been successfully made it is ready for writing to the target controller.

Download and Start the Application

Application downloading and execution control is accomplished using the IEC 61131-3 debugger. Refer to section **A.15 Using the graphic debugger** of the IEC 61131-3 User's Guide for complete information on the debugger.

To download an application to the target controller:

- Select Debug from the Debug menu in the Programs window.
- The debugger automatically connects to the target controller using the communication link. The Debugger window is opened.
- Select Download from the File menu in the Debugger window.

- Select ISA86M: TIC code for Intel from the Download dialog.
- A progress bar will display the progress of the download command.
- Once the download is complete the application will start to run.

The application may now be viewed in real time. Select the **Dictionary** or one of the programs in the Programs window to view real time data.

The Quick-Start procedure is complete!

Troubleshooting
